Contents

A Introduction 1
1 How do proteases recognize substrates? .......................... 1
2 Structure and functionality of FtsH and Lon ...................... 3
3 Cellular functions and recognition principles of FtsH .............. 5
  3.1 Quality control of cytoplasmic proteins ....................... 5
  3.2 Quality control of membrane proteins ......................... 6
  3.3 Dual role in lipopolysaccharide biosynthesis .................. 7
  3.4 Control of the heat shock response ............................. 10
  3.5 Further cytoplasmic substrates of FtsH ....................... 13
  3.6 FtsH substrates in other bacterial species .................... 16
4 Recognition and degradation of cytoplasmic proteins by Lon ........ 18
5 Objectives of this work ............................................ 23

B Region C of the Escherichia coli heat shock sigma factor RpoH (σ32) contains a turnover element for proteolysis by the FtsH protease 25

C Control of LPS biosynthesis by FtsH-mediated proteolysis of LpxC is conserved in enterobacteria but not in all Gram-negative bacteria 36
  1 Supplemental material ............................................ 45

D The Escherichia coli replication inhibitor CspD is subject to growth-regulated degradation by the Lon protease 54

E Identification of Escherichia coli protease substrates using a comparative 2D gel approach 68
  Abstract .......................................................... 69
  Introduction ....................................................... 69
  Results & discussion ............................................. 70
  Material & methods ............................................... 83
  Supplemental material .......................................... 86

F Discussion 91
  1 Proteolysis of RpoH to control the heat shock response and cell division 91
    1.1 Which functions fulfill the turnover elements in regions 2.1 and C? 92
  2 Role of regulated proteolysis for control of LPS biosynthesis between species 94
